

```

/*****
Module
    EventCheckers.c

Revision
    1.0.1

Description
    This is the sample for writing event checkers along with the event
    checkers used in the basic framework test harness.

Notes
    Note the use of static variables in sample event checker to detect
    ONLY transitions.

History
    When          Who          What/Why
    -----

// this will pull in the symbolic definitions for events, which we will want
// to post in response to detecting events
#include "ES_Configure.h"
// This gets us the prototype for ES_PostAll
#include "ES_Framework.h"
// this will get us the structure definition for events, which we will need
// in order to post events in response to detecting events
#include "ES_Events.h"
// if you want to use distribution lists then you need those function
// definitions too.
#include "ES_PostList.h"
// This include will pull in all of the headers from the service modules
// providing the prototypes for all of the post functions
// #include "ES_ServiceHeaders.h"
// this test harness for the framework references the serial routines that
// are defined in ES_Port.c
#include "ES_Port.h"
// include our own prototypes to insure consistency between header &
// actual functions definition
#include "EventCheckers.h"

// #include "inc/hw_memmap.h"
// #include "inc/hw_types.h"
// #include "inc/hw_gpio.h"
// #include "inc/hw_sysctl.h"
// #include "LimitSwitchService.h"
// #include "HarvestButtonService.h"

// This is the event checking function sample. It is not intended to be
// included in the module. It is only here as a sample to guide you in writing
// your own event checkers
#if 0
/*****
Function
    Check4Lock
Parameters
    None
Returns
    bool: true if a new event was detected
Description
    Sample event checker grabbed from the simple lock state machine example
Notes
    will not compile, sample only

```

Author

J. Edward Carryer, 08/06/13, 13:48

```
bool Check4Lock(void)
{
    static uint8_t LastPinState = 0;
    uint8_t CurrentPinState;
    bool ReturnVal = false;

    CurrentPinState = LOCK_PIN;
    // check for pin high AND different from last time
    // do the check for difference first so that you don't bother with a test
    // of a port/variable that is not going to matter, since it hasn't changed
    if ((CurrentPinState != LastPinState) &&
        (CurrentPinState == LOCK_PIN_HI)) // event detected, so post detected
event
    {
        ES_Event ThisEvent;
        ThisEvent.EventType = ES_LOCK;
        ThisEvent.EventParam = 1;
        // this could be any of the service post functions, ES_PostListx or
        // ES_PostAll functions
        ES_PostAll(ThisEvent);
        ReturnVal = true;
    }
    LastPinState = CurrentPinState; // update the state for next time

    return ReturnVal;
}
```

#endif

```
Function
    Check4Keystroke
Parameters
    None
Returns
    bool: true if a new key was detected & posted
Description
    checks to see if a new key from the keyboard is detected and, if so,
    retrieves the key and posts an ES_NewKey event to TestHarnessService0
Notes
    The functions that actually check the serial hardware for characters
    and retrieve them are assumed to be in ES_Port.c
    Since we always retrieve the keystroke when we detect it, thus clearing the
    hardware flag that indicates that a new key is ready this event checker
    will only generate events on the arrival of new characters, even though we
    do not internally keep track of the last keystroke that we retrieved.
```

Author

J. Edward Carryer, 08/06/13, 13:48

```
bool Check4Keystroke(void)
{
    if (IsNewKeyReady()) // new key waiting?
    {
        ES_Event_t ThisEvent;
        ThisEvent.EventType = ES_NEW_KEY;
        ThisEvent.EventParam = GetNewKey();
        ES_PostAll(ThisEvent);
        //printf("%c/r/n", ThisEvent.EventParam);
        return true;
    }
    return false;
}
```
